

National University of Computer and Emerging Sciences, Lahore Campus

	Course Name:	Professional Practices	Course Code:	CS 4001
	Program:	BS (Computer Science)	Semester:	Spring 2026
	Instructor:	Shehryar Raza (VF)	Section	CS (6C)
	Exam Type:	Quiz 2 - Version B	Total Marks:	20

Student Name

Roll No.

Q1. Encircle the correct option from the given Questions: [8 marks]

Software manufacturers distribute their products in binary machine language primarily to:

- A. Make the software run faster on modern CPUs.
- B. Comply with international WTO TRIPS requirements.
- C. **Protect intellectual property by making the code non human readable.**
- D. Enable the use of decompilers by end users.

Which of the following is an example of 'nominative fair use' in trademark law?

- A. Creating a new soft drink and naming it 'Coca-Kola'.
- B. **Referring to a trademarked brand to explain that your product is compatible with it.**
- C. Registering a domain name like 'yahoozone.com' to get traffic.
- D. Using a competitor's logo on your own product to imply a merger.

Under the Anticybersquatting Consumer Protection Act (ACPA), what must a trademark owner prove to win a case against a domain registrant?

- A. The registrant has a legitimate business interest in the name.
- B. The registrant lives in the same state as the trademark owner.
- C. **The domain was registered in bad faith with intent to profit from the trademark.**
- D. The registrant has used the domain for at least five years.

What is the function of the 'Safe Harbor' provision for ISPs under the Digital Millennium Copyright Act (DMCA)?

- A. **It protects ISPs from liability for their users actions if they follow notice and takedown procedures.**
- B. It requires ISPs to prove copyright infringement in court before removing any content.
- C. It exempts ISPs from ever having to remove infringing content.
- D. It gives ISPs the right to charge copyright holders for every takedown notice.

A competitor's salesperson deliberately tells a lie to a receptionist at your company to gain access to a secure area and photograph a prototype. This is an example of crossing the line from CI into:

- A. Patent farming
- B. **Industrial espionage**
- C. Nominative fair use
- D. Standard defensive publishing

Unlike copyright law, how does U.S. patent law treat a defendant who can prove they independently created the infringing invention without any knowledge of the existing patent?

- A. **Independent creation is not a defense against patent infringement.**
- B. Independent creation serves as a complete affirmative defense.
- C. The defendant is only liable for actual damages, not triple damages.
- D. The patent is automatically rendered invalid due to the 'many eyes' principle.

An IT company participates in a standards-setting organization but deliberately conceals a pending patent application for a technology being considered for the standard. This practice is known as:

- A. **Patent Farming**

- B. Defensive Publishing
- C. Cross-Licensing
- D. Nominative Fair Use

A manager is concerned that a competitive intelligence (CI) analyst might be crossing the line into industrial espionage. Which of the following actions by the analyst would be considered unethical or potentially illegal?

- A. Analyzing the meta tags and source code of a competitor's public website.
- B. Reviewing a competitor's public job postings to determine their future technology stack.
- C. Attending a trade show and taking notes on a public product demonstration.
- D. Striking up a conversation with a rival's employees at a bar to ply them for secrets after they have been drinking.

Q2. Carefully read the Question before attempting:

[12 marks]

Synaptech BioSystems Inc. is launching CerebraGrid, a neuro-AI platform combining embedded systems, licensed software, outsourced design, and confidential healthcare data. The company must choose the most effective primary IP protection for each component, considering ownership risks, licensing constraints, and enforceability. Product components include:

1. **Adaptive Neural Compression Model:** A self-optimizing model that dynamically reduces neural signal bandwidth with unprecedented efficiency, implemented at the firmware level in edge devices.
2. **Automated Insight Narratives:** Generates natural language diagnostic summaries using predefined linguistic templates combined with AI-generated interpretations.
3. **Augmented Reality (AR) Visualization Layer:** Displays cognitive metrics through interactive 3D brain models; developed by an external studio under a revenue-sharing agreement with no explicit IP assignment clause.
4. **Federated Clinical Data Engine:** Aggregates insights from multiple hospitals without transferring raw patient data while relying on confidential protocols.
5. **Brand Suite "CerebraGrid: Intelligence, Rewired":** Used across international markets, including localized translations and region-specific branding adaptations.
6. **Distributed Training Orchestrator:** Built partially on an Apache 2.0 licensed framework, but significantly extended with proprietary scheduling logic for real-time distributed learning.

For each component (1–6), determine the most suitable form of intellectual property protection (Copyright, Patent, Trade Secret, or Trademark). Select exactly one:

1.	Patent
2.	Copyright
3.	Copyright
4.	Trade Secret
5.	Trademark
6.	Copyright
